

# Week 1-2: Foundation & Domain Structure

## Project Structure Overview

## Detailed File Structure

### 1. Domains Directory

Each domain represents a core business capability and follows consistent internal structure.

src/domains/

│   │   ├── reset.css
│   │   └── utilities.css
│   └── index.ts
└── config/
    ├── theme.ts
    ├── environment.ts
    ├── features.ts
    └── index.ts
```

### 3. App Directory

Application shell and configuration.

```
src/app/
├── routing/
│   ├── AppRouter.tsx
│   ├── ProtectedRoute.tsx
│   ├── RouteConfig.ts
│   └── index.ts
├── layout/
│   ├── AppLayout.tsx
│   ├── ErrorBoundary.tsx
│   └── index.ts
├── providers/
│   ├── AppProviders.tsx
│   ├── QueryProvider.tsx
│   ├── ErrorProvider.tsx
│   └── index.ts
└── index.ts
```

## 4. Types Directory

Global TypeScript definitions.

```
src/types/
├── api.ts          # API response/request types
├── common.ts       # Shared utility types
├── entities.ts     # Core business entity types
├── events.ts       # Domain events
├── permissions.ts  # Authorization types
└── index.ts
```

## 5. Root Level Files

```
src/
├── index.tsx       # Application entry point
├── App.tsx         # Root App component
└── setupTests.ts   # Test configuration
```

## Implementation Order

### Day 1-2: Core Structure Setup

1. Create the folder structure
2. Set up basic TypeScript configurations
3. Create initial index.ts files with proper exports

## Day 3-4: Shared Foundation

1. Implement base atomic components (Button, Input, Icon)
2. Set up theme and styling tokens
3. Create core contexts (App, Theme, Auth)

## Day 5-6: Domain Scaffolding

1. Create domain-specific folder structures
2. Define initial TypeScript interfaces for each domain
3. Set up basic service interfaces

## Day 7-8: Context Architecture

1. Implement domain-specific contexts
2. Set up data flow patterns
3. Create basic hooks for each domain

## Day 9-10: Migration Planning

1. Map existing components to new structure
2. Create migration scripts for moving code
3. Set up build and test configurations

This structure provides:

- **Clear separation of concerns** between domains
- **Atomic design consistency** across all components
- **Scalable architecture** for adding new features
- **Type safety** throughout the application
- **Testability** with isolated, mockable services
- **Maintainability** through consistent patterns

Would you like me to detail the specific implementation of any particular domain or shared component?
